

Iowa

Walking on streets designed more for speeding cars than for people on foot can be deadly. More than 4,500 Americans died last year while crossing the street, walking to school, going to a bus stop, or strolling to the grocery store. But *not* walking is equally as hazardous. Partly out of traffic safety fears, people are walking less these days, with serious consequences for our weight and health. The CDC reports that two-thirds of Americans are now overweight or obese.

The good news is that communities that choose to change road policies and invest in safer designs see fewer deaths and injuries, even as they make their neighborhoods more livable and invite more people to walk and bicycle. Though growing in number, these places are still the exception rather than the rule.
